

Octane Ajax: Etsy 403 Connection Fix Plan

The Diagnosis

You are seeing “Etsy connection failed: Failed to load Etsy shop (403)” after the OAuth handshake.

What happened:

1. Claude’s fix for the “cookies blocked” issue (swapping `<ButtonLink>` to a standard `<a>` tag) **worked**. It was committed and deployed.
2. The OAuth code exchange works perfectly. You successfully get an Etsy access token.
3. However, when the system calls `GET /v3/application/users/{userId}/shops` to fetch your shop ID, Etsy returns a `403 Forbidden`.

The Root Cause: Etsy made a breaking API change that was strictly enforced starting **February 9, 2026**. All API calls must now format the `x-api-key` header as `<keystring>:<shared_secret>`.

Your code in both `etsy-auth.ts` and `etsy.ts` currently only sends the keystring:

```
"x-api-key": clientId // Missing the :shared_secret
```

Because the secret is missing, Etsy instantly rejects the request with a 403.

Cursor Implementation Prompts

Copy and paste the prompt below into a new Cursor Composer window to fix the bug.

Window 1: Fix Etsy Header Format

The Etsy OAuth connection is failing with a 403 because Etsy started enforcing header format.

Please fix this across the codebase:

1. In ``src/lib/ajax/etsy-auth.ts``:

- Update ``getEtsyAuthConfig`` to also return ``clientSecret: process.env.ETSY_CLIENT_SECRET``
- Update ``etsyApiHeaders`` to accept ``clientSecret`` and format the headers
- Update ``fetchEtsyShopIdForUser`` to pass the ``clientSecret`` to ``etsyApi``

2. In ``src/lib/ajax/adapters/etsy.ts``:

- Update ``getClientId`` (or create a ``getEtsyConfig``) to return both ``clientId`` and ``clientSecret``
- Update ``authHeaders`` to accept ``clientSecret`` and format the headers
- Update ``createEtsyAdapter`` and its methods to pass the ``clientSecret``

3. Make sure ``ETSY_CLIENT_SECRET`` is properly documented in ``.env.example``

Do not change any other OAuth logic. The token exchange itself is working

Post-Implementation Steps

1. **Verify your Vercel Environment Variables:** Make sure you have BOTH `ETSY_CLIENT_ID` (your keystring) and `ETSY_CLIENT_SECRET` (your shared secret) set in your Vercel project settings.
2. **Test the Connection:** Go to Settings -> Connect Etsy Shop. The flow should now complete successfully and save your `shop_id` to the Supabase database.
3. **Check Your Shop Status:** If you still get a `404/403` after this code fix, it means the Etsy account you logged in with does not actually have an active shop open yet. You must complete the Etsy seller onboarding (open a shop, add billing info) before the API can return a shop ID.
